## Git

- How to use Git?

# How to use Git?

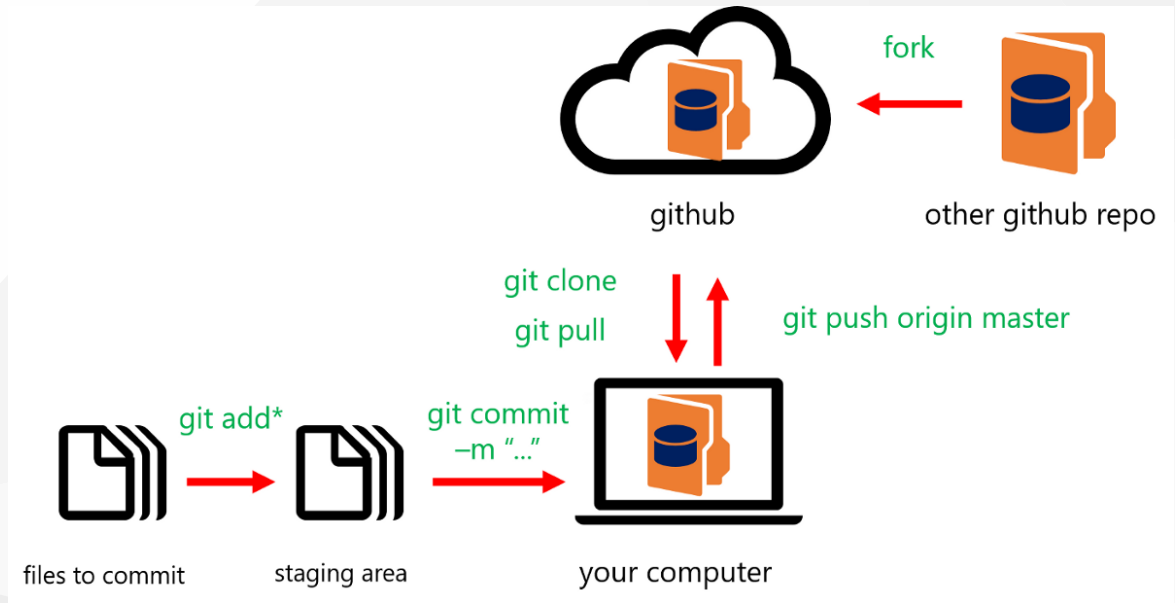

# Git

- **Here is a basic overview of how Git works**
  - 1.Create a "repository" (project) with a git hosting tool (like Bitbucket)
  - 2.Copy (or clone) the repository to your local machine
  - 3.Add a file to your local repo and "commit" (save) the changes
  - 4."Push" your changes to your main branch
  - 5.Make a change to your file with a git hosting tool and commit
  - 6."Pull" the changes to your local machine
  - 7.Create a "branch" (version), make a change, commit the change
  - 8.Open a "pull request" (propose changes to the main branch)
  - 9."Merge" your branch to the main branch

## Git

- **Sample git notation**

A simple modeled version of the git shown in this image.

## Git

- Simple "git init" notation

The git init command creates a new Git repository. It can be used to convert an existing, unversioned project to a Git repository or initialize a new, empty repository.

```
Akash Jha@LAPTOP-LJJ1U61G MINGW64 ~/Desktop/Git/SetUp (master)
$ git status
On branch master

No commits yet

Untracked files:
(use "git add <file>..." to include in what will be committed)
  file1.txt
  file2.txt

nothing added to commit but untracked files present (use "git add" to track)

Akash Jha@LAPTOP-LJJ1U61G MINGW64 ~/Desktop/Git/SetUp (master)
$ git add .

Akash Jha@LAPTOP-LJJ1U61G MINGW64 ~/Desktop/Git/SetUp (master)
$ git status
On branch master

No commits yet

Changes to be committed:
(use "git rm --cached <file>..." to unstage)
  new file:   file1.txt
  new file:   file2.txt
```

## Git

- How to use "git add"  
Here you see using a git add from the command line.

```
HiManshU@HiManshU-PC MINGW64 ~/Desktop/NewDirectory (master)
$ touch newfile4.txt

HiManshU@HiManshU-PC MINGW64 ~/Desktop/NewDirectory (master)
$ git status
On branch master
Changes not staged for commit:
  (use "git add <file>..." to update what will be committed)
  (use "git restore <file>..." to discard changes in working directory)
        modified:   newfile3.txt

Untracked files:
  (use "git add <file>..." to include in what will be committed)
        newfile4.txt

no changes added to commit (use "git add" and/or "git commit -a")

HiManshU@HiManshU-PC MINGW64 ~/Desktop/NewDirectory (master)
$ git commit -a
[master fc66f84] updated newfile3
1 file changed, 1 insertion(+)
```

## Git

- How to use "git commit"

Here you see using a git commit from the command line.
